SUSPENSION AEROSOL FORMULATIONSBACKGROUND OF THE INVENTION5 Field of the Invention

This invention relates to pharmaceutical aerosol formulations. In another aspect this invention relates to pharmaceutical suspension aerosol formulations wherein the propellant comprises HFC 134a or HFC 227. In another aspect, it relates to pharmaceutical suspension aerosol formulations containing pirbuterol. In another aspect, it relates to pharmaceutical suspension aerosol formulations containing albuterol sulfate.

15

Description of the Related Art

Pharmaceutical suspension aerosol formulations currently use a mixture of liquid chlorofluorocarbons as the propellant.

20 Fluorotrichloromethane, dichlorodifluoromethane and dichlorotetrafluoroethane are the most commonly used propellants in aerosol formulations for administration by inhalation.

Chlorofluorocarbons (CFCs), however, have 25 been implicated in the destruction of the ozone layer and their production is being phased out.

Hydrofluorocarbon 134a (HFC 134a, 1,1,1,2-tetrafluoroethane) and hydrofluorocarbon 227 (HFC 227, 1,1,1,2,3,3-heptafluoropropane) are viewed as being 30 more ozone friendly than many chlorofluorocarbon propellants; furthermore, they have low toxicity and vapor pressures suitable for use in aerosols.

Patent Applications WO 91/11495 and WO 91/11496 (both by Weil) describe pharmaceutical 35 suspension aerosol formulations comprising a medicinal agent, optionally a surfactant, and a propellant mixture containing 1,1,1,2,3,3-heptafluoropropane and one or more additional components, e.g., pentane,

WO 93/11747

PCT/US92/10587

- 2 -

butane, propellant 134a, propellant 11, propellant 125, or propellant 152a.

European Patent Office Publication 0 384 371 (Heickel) describes solution aerosols in which

5 1,1,1,2,3,3-heptafluoropropane or its mixture with propane, butane, isobutane, dimethyl ether, or 1,1-difluoroethane serves as the propellant. The application does not, however, disclose suspension aerosols or pharmaceutical aerosol formulations.

10 European Patent Application 89.312270.5 (Purewal et al.) discloses, inter alia, aerosol formulations comprising a medicament, 1,1,1,2-tetrafluoroethane, a surface active agent, and at least one compound having higher polarity than 1,1,1,2-

15 tetrafluoroethane.

U.S. Pat. No. 2,868,691 (Porush et al.) discloses aerosol formulations comprising a medicament, a halogenated lower alkane propellant, and a cosolvent which assists in dissolving the medicament in the 20 propellant. The chemical formula for the propellant given in Col. 2, lines 6-16, generically embraces HFC 134a and HFC 227. Examples of cosolvents disclosed include ethanol and diethyl ether.

U.S. Pat. No. 3,014,844 (Thiel et al.) 25 discloses aerosol formulations comprising a micronized medicament, a halogenated lower alkane propellant and a surface-active agent to assist in the suspension of the medicament in the propellant. The chemical formula for the propellant given in Col. 4, lines 17-28, generically embraces HFC 134a and HFC 227.

Patent Application WO 90/01454 (Greenleaf et al.) discloses aerosol compositions having HFC 134a as the propellant and comprising a medicament coated with a non-perfluorinated surface active dispersing agent. 35 This application describes control formulations containing only HFC 134a and 0.866 percent by weight of a drug.

WO 93/11747

PCT/US92/10587

- 3 -

Albuterol sulfate is a relatively selective beta-2 adrenergic bronchodilator. It is available in a variety of dosage forms including tablets, syrups and formulations suitable for inhalation. For example, 5 VENTOLINTM Inhalation Aerosol (commercially available from Allen & Hansburys) is a metered dose aerosol unit containing a microcrystalline suspension of albuterol (free base) in propellant (a mixture of trichloromonofluoromethane and dichlorodifluoromethane) 10 with oleic acid. VENTOLIN ROTOCAPSTM for Inhalation (commercially available from Allen & Hansburys) contain a mixture of microfine albuterol sulfate with lactose and are intended for use with a specially designed device for inhaling powder. VENTOLINTM Solution for 15 Inhalation (commercially available from Allen & Hansburys) is an aqueous solution of albuterol sulfate intended for use with a nebulizer.

Pirbuterol acetate is a relatively selective beta-2 adrenergic bronchodilator. MAXAIRTM Inhaler 20 (commercially available from 3M Pharmaceuticals, St. Paul, MN) is a metered dose aerosol unit containing a fine-particle suspension of pirbuterol acetate in the propellant mixture of trichloromonofluoromethane and dichlorodifluoromethane, with sorbitan trioleate.

25

Summary of the Invention

This invention provides a pharmaceutical suspension formulation suitable for aerosol administration, consisting essentially of a 30 therapeutically effective amount of a drug and a propellant selected from the group consisting of HFC 134a, HFC 227, and a mixture thereof, said formulation being further characterized in that it exhibits substantially no growth in particle size or change in 35 crystal morphology of the drug over a prolonged period, is substantially and readily redispersible, and upon redisposition does not flocculate so quickly as to prevent reproducible dosing of the drug.

WO 93/11747

PCT/US92/10587

- 4 -

This invention also provides an aerosol canister containing a formulation as described above in an amount sufficient to provide a plurality of therapeutically effective doses of the drug. Also 5 provided is a method of preparing a formulation as described above, comprising the steps of: (i) combining an amount of the drug sufficient to provide a plurality of therapeutically effective doses and a propellant selected from the group consisting of HFC 10 134a, HFC 227, and a mixture thereof, in an amount sufficient to propel from an aerosol canister a plurality of therapeutically effective doses of the drug; and (ii) dispersing the drug in the propellant. This invention further provides a method of treating a 15 mammal having a condition capable of treatment by inhalation, comprising the step of administering by inhalation a formulation as described above to the mammal.

In another aspect, this invention provides 20 suspension aerosol formulations comprising a therapeutically effective amount of micronized albuterol sulfate and HFC 227 as substantially the only propellant. This invention also provides suspension aerosol formulations comprising a therapeutically 25 effective amount of micronized albuterol sulfate, from about 0.1 to about 15 percent by weight of ethanol, and HFC 227 as substantially the only propellant. This invention also provides suspension aerosol formulations comprising a therapeutically effective amount of 30 micronized albuterol sulfate, from about 5 to 15 percent by weight of ethanol, from about 0.05 to about 0.5 percent by weight of a surfactant selected from the group consisting of oleic acid and sorbitan trioleate, and HFC 227 as substantially the only propellant.

35 In another aspect this invention provides suspension aerosol formulations comprising a therapeutically effective amount of micronized pirbuterol acetate and a propellant comprising HFC 227,

WO 93/11747

PCT/US92/10587

- 5 -

the formulation being further characterized in that it is substantially free of perfluorinated surfactant. This invention also provides suspension aerosol formulations comprising a therapeutically effective 5 amount of micronized pирbutерол acetate, about 0.1 to about 12 percent by weight of ethanol, and a propellant comprising HFC 227. This invention also provides suspension aerosol formulations comprising a therapeutically effective amount of micronized 10 pирbutерол acetate, about 5 to about 12 percent by weight of ethanol, about 0.05 to about 0.5 percent by weight of oleic acid, and a propellant comprising HFC 227.

This invention also provides a method for 15 inducing bronchodilation in a mammal, comprising administering to the mammal a formulation as described above by inhalation.

Detailed Description of the Invention

20 The term "suspension aerosol formulation" as used herein refers to a formulation in which the drug is in particulate form and is substantially insoluble in the propellant.

Amounts expressed herein in terms of percent 25 refer to percent by weight based on the total weight of the formulation.

The formulations of the invention that consist essentially of drug and a propellant contain drug and propellant in relative amounts such that a 30 formulation suitable for aerosol administration is obtained without the need for additional components. Such formulations preferably contain less than an effective stabilizing amount of surfactant and more preferably are substantially free of surfactant and 35 other components.

The formulations of the invention contain a drug in a therapeutically effective amount, that is, an amount such that the drug can be administered as an

WO 93/11747

PCT/US92/10587

- 6 -

aerosol (e.g., topically or by oral or nasal inhalation) and cause its desired therapeutic effect with one dose, or less preferably several doses, from a conventional valve, e.g., a metered dose valve.

5 "Amount" as used herein refers to quantity or to concentration as appropriate to the context. The amount of a drug that constitutes a therapeutically effective amount varies according to factors such as the potency, efficacy, and the like, of the particular
10 drug, on the route of administration of the formulation, and on the device used to administer the formulation. A therapeutically effective amount of a particular drug can be selected by those of ordinary skill in the art with due consideration of such
15 factors. Particularly in formulations of the invention intended for oral inhalation into the lungs, the drug is preferably micronized, i.e., about 90 percent or more of the particles have a diameter of less than about 10 microns, in order to assure that the particles
20 can be inhaled into the lungs.

The particular amount of drug that will remain suspended in a formulation of the invention for a time sufficient to allow reproducible dosing of the drug depends to some extent on the nature of the
25 particular drug, e.g., its density, and on the particular propellant used in the formulation. Generally, however, it has been found that when drug concentrations of less than about 0.1 percent are used in a formulation of the invention the drug flocculates
30 to some degree but generally does not settle or cream to the extent that the suspension becomes unsuitable for use as an aerosol formulation, e.g., in a metered dose inhaler. Therefore as regards drug concentration such formulations are acceptably homogeneous.

35 When drug concentrations greater than about 0.1 percent but less than about 0.5 percent are used in a formulation of the invention it is sometimes seen that the drug flocculates considerably in the

WO 93/11747

PCT/US92/10587

- 7 -

formulation and therefore might have an increased tendency to cream or settle. As discussed below in connection with the propellant component of the formulations of the invention, in these instances it is 5 preferable to select the propellant in a manner that minimizes creaming and settling of the drug in order to assure that the formulation is acceptably homogeneous as regards drug concentration.

As drug concentration increases, e.g., beyond 10 about 0.5 percent, the tendency of the drug to flocculate generally increases also. However, the volume occupied by the flocculated drug also increases and the flocculated drug begins to occupy substantially all of the volume of the formulation. In such 15 instances the flocculated drug often shows a lesser tendency to cream or settle. As regards drug concentration such formulations are acceptably homogeneous.

Generally the concentration of the drug in a 20 formulation of the invention is preferably less than about 0.1 percent, more preferably less than about 0.08 percent, and most preferably less than about 0.05 percent. Accordingly, it is preferred according to this invention that the drug have a potency such that 25 concentrations less than about 0.1 percent, more preferably less than about 0.08 percent, and most preferably less than about 0.05 percent, are therapeutically effective. Preferred drugs for use in the formulations of the invention therefore include 30 formoterol, salmeterol, and pharmaceutically acceptable salts thereof, particularly formoterol fumarate. Other drugs that can be formulated according to this invention include albuterol, beclomethasone dipropionate, cromlyn, pirbuterol, and 35 pharmaceutically acceptable salts and solvates thereof, particularly albuterol sulfate, disodium cromoglycate, and pirbuterol acetate.

WO 93/11747

PCT/US92/10387

- 8 -

The propellant in a formulation of the invention can be HFC 134a, HFC 227, or a mixture thereof in any proportion. The propellant is present in an amount sufficient to propel a plurality of doses from a metered dose inhaler. The density of HFC 134a differs from the density of HFC 227. Therefore the density of the propellant can be adjusted within limits by using mixtures of HFC 134a and HFC 227 in order to accommodate the density of the drug. It is sometimes preferred that the propellant be selected such that the propellant density is as closely matched as possible to the drug density in order to minimize tendencies for the drug to settle or cream, particularly when drug concentration is greater than 0.1 percent or when the drug concentration is between about 0.1 percent and about 0.5 percent.

The pirbuterol acetate formulations of the invention contain a therapeutically effective amount of pirbuterol acetate. Preferably, the pirbuterol acetate constitutes about 0.4 to about 1.0 percent by weight, more preferably about 0.45 to about 0.9 percent by weight, of the aerosol formulation. Preferably the pirbuterol acetate is micronized.

Ethanol can optionally be included in a pirbuterol acetate aerosol formulation of the invention. When ethanol is present it constitutes from about 0.1 to about 12 percent by weight, preferably from about 5 to about 12 percent by weight of the aerosol formulation. In another aspect of this invention ethanol preferably constitutes from about 2 to about 8 percent by weight of the formulation. Oleic acid can optionally be included in a pirbuterol acetate formulation of the invention that includes ethanol. When oleic acid is present it constitutes about 0.01 to about 0.5 percent by weight of the formulation.

Typically the propellant constitutes the remainder of the weight of the formulation once the pirbuterol acetate and the optional ethanol and oleic

WO 93/11747

PCT/US92/10587

- 9 -

acid are accounted for. Accordingly the propellant is generally present in an amount of at least about 85 percent by weight based on the total weight of the formulation. The propellant in a pirbuterol acetate 5 formulation of the invention comprises HFC 227, preferably as substantially the only propellant. However, one or more other propellants such as propellant 142b (1-chloro-1,1-difluoroethane), HFC 134a, and the like can be used, preferably in 10 pirbuterol acetate formulations of the invention containing ethanol.

Preferred pirbuterol acetate formulations of the invention exhibit substantially no growth in particle size or change in crystal morphology of the 15 pirbuterol acetate over a prolonged period, are substantially and readily redispersible, and upon redispersion do not flocculate so quickly as to prevent reproducible dosing of pirbuterol acetate.

The albuterol sulfate formulations of the 20 invention contain a therapeutically effective amount of micronized albuterol sulfate. Preferably micronized albuterol sulfate constitutes about 0.3 to about 0.5 percent by weight, more preferably from about 0.35 to about 0.42 percent by weight of the aerosol 25 formulation.

Ethanol can optionally be included in such an albuterol sulfate formulation of the invention. When ethanol is present it constitutes from about 0.1 to about 20 percent by weight, preferably from about 5 to 30 about 15 percent by weight of the formulation. A surfactant selected from the group consisting of oleic acid and sorbitan trioleate can also optionally be included in the formulation when the formulation also includes ethanol. When a surfactant is present it 35 constitutes about 0.01 to about 0.5 percent by weight of the aerosol formulation. Albuterol sulfate formulations of the invention that do not contain

WO 93/11747

PCT/US92/10587

- 10 -

ethanol are preferably substantially free of perfluorinated surfactant.

Certain preferred albuterol sulfate suspension aerosol formulations of the invention 5 comprise HFC 227 as substantially the only propellant. Typically the propellant constitutes the remainder of the weight of the formulation once the albuterol sulfate and the optional surfactant and/or ethanol are accounted for. Accordingly the propellant is generally 10 present in an amount of at least about 75 percent by weight based on the total weight of the formulation.

Preferred albuterol sulfate formulations of the invention exhibit substantially no growth in particle size or change in crystal morphology of the 15 albuterol sulfate over a prolonged period, are substantially and readily redispersible, and upon redispersion do not flocculate so quickly as to prevent reproducible dosing of albuterol sulfate.

Generally the formulations of the invention 20 can be prepared by combining (i) the drug in an amount sufficient to provide a plurality of therapeutically effective doses; and (ii) the propellant in an amount sufficient to propel a plurality of doses from an aerosol canister; and dispersing the drug in the 25 propellant. The drug can be dispersed using a conventional mixer or homogenizer, by shaking, or by ultrasonic energy. Bulk formulation can be transferred to smaller individual aerosol vials by using valve to valve transfer methods or by using conventional cold- 30 fill methods.

The pirbuterol acetate suspension aerosol formulations of this invention can be prepared by combining the pirbuterol acetate and the propellant and then dispersing the pirbuterol acetate in the 35 propellant using a conventional mixer or homogenizer. Pirbuterol acetate, however, is somewhat soluble in ethanol alone. Accordingly, when oleic acid and/or ethanol are included in the formulation, it is

WO 93/11747

PCT/US92/10587

- 11 -

preferred that the pirbuterol acetate be first placed in an aerosol vial. A mixture of the propellant, citric acid and/or ethanol can then be added, and the pirbuterol acetate dispersed in the mixture.

5 The albuterol sulfate suspension aerosol formulations of this invention can be prepared by combining the albuterol sulfate and the propellant and dispersing the albuterol sulfate in the propellant using a conventional mixer or homogenizer. When a
10 surfactant and/or ethanol are included in the formulation, they can be added to the propellant along with the albuterol sulfate.

Aerosol canisters equipped with conventional valves, preferably metered dose valves, can be used to
15 deliver the formulations of the invention. It has been found, however, that selection of appropriate valve assemblies for use with aerosol formulations is dependent upon the particular surfactants or adjuvants used (if any), on the propellant, and on the particular
20 drug being used. Conventional neoprene and buna valve rubbers used in metered dose valves for delivering conventional CFC formulations often have less than optimal valve delivery characteristics and ease of operation when used with formulations containing HFC
25 134a or HFC 227. Moreover, conventional CFC formulations generally contain a surfactant in part as a lubricant for the valve stem. Some formulations of the invention, however, do not contain a surfactant or a lubricant. Therefore certain formulations of the
30 invention are preferably dispensed via a valve assembly wherein the diaphragm is fashioned by extrusion, injection molding or compression molding from a thermoplastic elastomeric material such as FLEXOMER™ DFDA 1137 NT7 polyolefin, FLEXOMER™ DFDA 1136 NT
35 polyolefin, FLEXOMER™ DEPD 8923 NT polyolefin, FLEXOMER™ GERS 1085 NT polyolefin, FLEXOMER™ DFDA 1163 NT7 polyolefin, FLEXOMER™ 1491 NT7 polyolefin, FLEXOMER™ 9020 NT7 polyolefin, FLEXOMER™ 9042 NT

WO 93/11747

PCT/US92/10587

- 12 -

polycloafin (Union Carbide), C-FLEX™ thermoplastic elastomer R70-001, C-FLEX™ thermoplastic elastomer R70-051, C-FLEX™ thermoplastic elastomer R70-041, C-FLEX™ thermoplastic elastomer R70-085, C-FLEX™ thermoplastic elastomer R70-003, or C-FLEX™ thermoplastic elastomer R70-026 (Concept Polymer Technologies), or a blend of two or more thereof.

Conventional aerosol canisters, e.g., those of aluminum, glass, stainless steel, or polyethylene terephthalate, can be used to contain a formulation of the invention.

The formulations of the invention can be delivered to the lung by oral inhalation in order to affect bronchodilation or in order to treat a condition susceptible of treatment by inhalation, e.g., asthma, chronic obstructive pulmonary disease. The formulations of the invention can also be delivered by nasal inhalation in order to treat, e.g., allergic rhinitis, rhinitis, or diabetes, or they can be delivered via topical (e.g., buccal) administration in order to treat, e.g., angina or local infection.

The following Examples are provided to illustrate the invention. All parts and percentages are by weight unless otherwise indicated.

25

Example 1

Formulations in HFC 134a

For each of the micronized drug substances A-G set forth below, formulations were prepared at drug concentrations of 0.017 percent, 0.039 percent, 0.083 percent, 0.41 percent, and 1.6 percent by weight based on the total weight of the formulation (corresponding to 0.20 mg/mL, 0.50 mg/mL, 1.0 mg/mL, 5.0 mg/mL, and 20 mg/mL, respectively). The formulations were prepared by dispersing micronized drug in HFC 134a in a sealed 15 mL clear PET vial using ultrasonic energy.

WO 93/11747

PCY/US92/10587

- 13 -

	A	Bclomethasone dipropionate
	B	Albuterol
	C	Albuterol sulfate
	D	Formoterol fumarate
5	E	Disodium cromoglycate
	F	Pirbuterol acetate

For each drug the lowest concentration formulation (0.017 percent by weight) was well dispersed and easily redispersible after standing. None of the formulations at this concentration showed any tendency to flocculate rapidly. As drug concentration increased to 0.41 percent visible flocs started to appear, different drugs having a greater or 15 lesser tendency to flocculate. The increase in flocculation with increasing concentration resulted in an increasing rate of sedimentation or creaming (depending on the particular drug involved) of suspended drug.

20 As drug concentration was further increased the formulations flocculated but maintained a state of greater homogeneity as the flocculated drug began to occupy more of the formulation volume.

Using time lapse photography 10 and 30 25 seconds after agitation the formulations were assessed as follows:

	<u>Concentration(%)</u>	<u>Drug</u>					
		A	B	C	D	E	F
30	0.017	+	+	+	+	+	+
	0.039	+	+	+	?	+	+
	0.083	?	?	+	?	?	?
	0.41	-	-	-	-	-	?
	1.63	+	+	-	+	-	+
35	+ =	visually acceptable formulation					
	- =	visually unacceptable formulation					
	? =	border line acceptable formulation					

WO 93/11747

PCT/US92/10587

- 14 -

These results show that each of the drug substances evaluated can be formulated in HFC 134a alone. The formulations retain homogeneity after shaking to form satisfactory formulations for use with 5 a metered dose inhaler. Formulations of low concentration were particularly homogenous. Formulations of intermediate concentration were of varying degrees of acceptability.

At the high concentration of 1.6 percent the 10 drugs with density close to the propellant density (beclomethasone dipropionate and albuterol) formed particularly homogenous suspensions due to the flocculated drug occupying substantially all of the formulation volume. These suspensions would be 15 expected to form satisfactory formulations for use with a metered dose inhaler.

Example 2

Formulations in HFC 227

20 Formulations of disodium cromoglycate (DSCG) were prepared at concentrations of 0.015 percent, 0.035 percent, 0.070 percent, 0.35 percent, and 1.4 percent by weight based on the weight of the formulation with HFC 227 as the propellant in a similar manner to those 25 prepared in Example 1 (again corresponding to 0.20, 0.50, 1.0, 5.0, and 20 mg/mL, respectively).

Formulations were particularly homogenous at concentrations of 0.015 percent, 0.035 percent, and 0.070 percent by weight. At 0.35 percent and 1.4 30 percent the formulations exhibited more rapid flocculation and sedimentation.

These results show that disodium cromoglycate can be formulated in HFC 227 with no surfactant or other adjuvant.

35

WO 93/11747

PCT/US92/10587

- 15 -

Comparative Example

Formulations with CFCs

Albuterol sulfate was formulated in two propellant mixes A and B, with no surfactant or 5 adjuvant.

Propellant mix A: Propellant 11 5%
Propellant 114 14.25%
Propellant 12 80.75%

10

Propellant mix B: Propellant 11 25%
Propellant 114 25%
Propellant 12 50%

15

For each propellant mix the range of drug concentrations used in Example 1 was used.

The formulations at 0.20 mg/mL, 0.50 mg/mL, and 1.0 mg/mL were acceptably homogenous. The formulations at 5.0 mg/mL and 20 mg/mL exhibited 20 relatively rapid flocculation. Notably, all these comparative formulations exhibited more caking of drug on the walls of the container than their HFC 134a counterparts of Example 1.

25

Example 3

Formulation of Formoterol Fumarate with Mixtures of HFC 227 and HFC 134a

Formoterol fumarate was formulated as set forth in Example 1 at concentrations of 0.015 percent, 30 0.038 percent, 0.076 percent, 0.38 percent, and 1.5 percent (0.20, 0.50, 1.0, 5.0, and 20 mg/mL, respectively) in a 1:1 mixture (W/W) of HFC 134a and HFC 227.

These formulations of formoterol fumarate 35 show reduced flocculation and a slower sedimentation rate than the corresponding formulations of Example 1 above involving HFC 134a alone.

WO 93/11747

PCT/US92/10587

- 16 -

The formulations were photographed using time lapse photography at 10 and 30 seconds post agitation and were assessed as follows:

	<u>Drug Concentration (%)</u>	<u>Assessment</u>
5	0.015	+
	0.038	+
	0.076	?
	0.38	?
10	1.5	+

These results show that the use of HFC 227 in combination with HFC 134a as a propellant affords formoterol fumarate suspensions with reduced flocculation and greater homogeneity compared with corresponding formulations with HFC 134a alone as the propellant.

Example 4

20 **Formulations of Beclomethasone Dipropionate (BDP)**

BDP formulations were prepared at 0.070 percent by weight (1.0 mg/mL) in HFC 227 and at 0.38 percent by weight (5.0 mg/mL) in a 1:1 mixture of HFC 227 and HFC 134a.

25 The formulation at 0.070 percent in HFC 227 was fairly well dispersed. Flocculation occurred at about 10 seconds after shaking and then creaming about 30 seconds after shaking.

30 The formulation at 0.38 percent in HFC 134a/HFC 227 involved a drug with a density closely matched to the propellant density. Although flocculation was rapid (small flocs were visible almost immediately after shaking) the flocs neither settled nor creamed.

35 The results show that it is possible to density match the drug to the propellant mix such that only the flocculation characteristics of the formulations influence homogeneity.

Example 5

Salmeterol Formulations in HFC 134a and HFC 227

Formulations of salmeterol free base at 0.02 percent by weight and 0.05 percent by weight were prepared in HFC 134a and in HFC 227 by placing the drug and 3 mL of glass beads into a 15 mL glass vial, crimping on a continuous valve, and adding the appropriate amount of propellant. The formulations were shaken on a paint shaker for 10 min in order to disperse the drug. The drug was seen to cream in both propellants, more so in HFC 227 than in HFC 134a. Flocculation was also apparent. However, the formulations were deemed suitable for use in connection with a metered dose inhaler.

15

Example 6

Formoterol Formulations in HFC 227

A formulation containing 0.01 percent by weight of formoterol fumarate in HFC 227 was prepared in an aerosol canister equipped with a 50 μ L SPRAYMISERTM pressure-fill metered dose valve. The formulation was prepared by placing 10 mg formoterol fumarate and 30 mL of glass beads in a 120 mL (4 ounce) glass vial, crimping on continuous valve, and adding 100 g of HFC 227. The vial was then shaken on a paint shaker, chilled, and the contents transferred to 10 mL vials fitted with the metered dose valve. The suspension was acceptably stable to settling and creaming. Valve delivery was measured through the life of the formulations. The results are shown in the Table below.

SHOT NUMBER (micrograms per shot)					
	1-4	54-57	107-110	160-163	173-177

Example 7

Formoterol Formulations in HFC 134a

A formulation containing 0.02 percent by

5 weight formoterol fumarate in HFC 134a was prepared and tested using a 50 μL SPRAYMISER™ pressure-fill metered dose valve. Test methods and results are set forth below.

10 SUSPENSION AEROSOL PARTICLE SIZE ANALYSIS

The particle size distribution of drug in the aerosol suspension is assayed by Malvern Mastersizer™ Particle Size Analyser using a suspending medium of 0.01 percent sorbitan trioleate in heptane.

15 Using a primed connector, shots are fired via an injection adapter into the Malvern sample cell containing the suspending medium. When a suitable level of obscuration (in the range 8.5 - 9) is achieved, analysis by laser diffraction is then

20 performed.

The results below show the percentage by weight of particles having particle size below 10.7 μm , below 5.07 μm , and below 1.95 μm . The "Initial" entries represent the average of three independent

25 determinations, and the "25°C", "CYC", and "HHC" entries represent a single determination after one month under the indicated storage conditions.

VALVE DELIVERY

35 This test is carried out at 20°C using 30 individual canisters. Each canister is primed by firing 10 successive shots just prior to the determination. The weight in mg of one shot from each of the 30 canisters is measured. The average weight of 40 the 30 doses is calculated and recorded as the mean. Also shown below is the number of individual dose weights differing by more than 7.5 percent and by more than 15 percent from the mean weight.

5 THROUGH LIFE DELIVERY

Delivery of drug ex valve is determined by firing ten shots through a stainless steel, circular adapter boss under liquid. The aerosol canister to be examined is primed prior to use. The canister is 10 shaken and allowed to stand for 15 seconds between shots. The sample solutions are assayed by HPLC.

The above test was carried out on shots 6-15, 46-55, and 91-100 of the canister.

35 TWIN STAGE IMPINGER

Glass impinger apparatus A (BP198 Appendix XVIIIC) is used. To determine the deposition of the emitted dose, the apparatus is assembled as described. The oral adapter is attached to the throatpiece of the apparatus, and a suitable pump is connected to the outlet of the apparatus. The air flow through the apparatus is 60 ± 5 liters per minute measured at the inlet of the throat. The canister to be examined is

WO 93/11747

PCT/US92/10587

- 22 -

primed prior to use, shaken, and allowed to stand for 15 seconds between shots. Ten shots are then fired via the adapter into the apparatus from the canister.

- The apparatus is then dismantled and each
- 5 stage washed with the appropriate amount of methanol. The washings are assayed by HPLC to give the content of the drug found at each stage and also the material balance.

Example 8

A 1.35 g portion of micronized pirbuterol acetate, 15.0 g of ethanol and 30 mL of glass beads 5 were placed in a 120 mL (4 ounce) glass aerosol vial. The vial was sealed with a continuous valve, pressure filled with approximately 133 g of HFC 227 and then shaken on a paint shaker for 10 minutes. The resulting formulation contained 0.9 percent by weight of 10 pirbuterol acetate and 10.0 percent by weight of ethanol. The dispersion was transferred into 10 mL aerosol vials which were sealed with 25 μ L Spraymiser[®] Aerosol Valves (available from Neotechnic Engineering Ltd.).

15 This formulation was tested for its ability to deliver a consistent dose throughout the "life" of the aerosol by determining the amount of pirbuterol acetate delivered per shot for shots 1, 2, 101, 102, 201, 202, 301 and 302. The amount delivered per shot 20 was determined using the assay described below. The results are shown in the table below.

A firing disk was placed in a 100 mL beaker and submerged in about 30 mL of diluent (55 parts methanol/ 45 parts 0.1 percent phosphoric acid, v/v). 25 The vial was shaken, inserted into the firing disk, and actuated. The valve and valve stem were rinsed into the beaker with additional diluent. The solution in the beaker was quantitatively transferred to a 100 mL volumetric flask which was then brought to volume with 30 additional diluent. The amount of pirbuterol acetate in the solution was determined using high performance liquid chromatography.

Example 9

A 11.7 g portion of pirbuterol acetate was placed in a beaker then chilled in a dry ice/trichlorofluoromethane bath. A portion of prechilled HFC 227 was added to the beaker and the resulting slurry was mixed at high speed with a VIRTIS™ Model 45 mixer for at least 3 minutes. The dispersed concentrate was then transferred to a glass bottle and enough prechilled HFC 227 was added to bring the total net content weight to 1300 g. The resulting formulation contained 0.9 percent by weight of pirbuterol acetate. The formulation was transferred to a cold filling system and filled into 10 mL aluminum aerosol vials which were then sealed with 25 µL valves. The formulation was deemed to be suitable for use in connection with a metered dose inhaler.

30

Example 10

A 11.7 g portion of micronized pirbuterol acetate, 3.0 g of oleic acid and 50 g of ethanol were placed in a beaker and homogenized for at least 3

WO 93/11747

PCT/US92/10587

- 25 -

minutes. The resulting slurry was transferred to a tared glass bottle and enough ethanol was added to bring the total weight of the concentrate to 144.7 g. The concentrate was chilled then placed along with 1155 5 g of prechilled HFC 227 into a prechilled cold filling system. The formulation was filled into 10 mL aluminum aerosol vials which were then sealed with 25 μ L SpraymiserTM valves. The resulting formulation contained 0.90 percent by weight of pirbuterol acetate, 0.23 10 percent by weight of oleic acid and 10.0 percent by weight of ethanol. The formulation was deemed to be suitable for use in connection with a metered dose inhaler.

In Examples 11-12 below, respirable fraction 15 is determined using the test method described below.

Respirable Fraction

In this assay the respirable fraction (the percent by weight of particles having an aerodynamic 20 particle size of less than 4.7 microns) of the aerosol suspension is determined using an Anderson Cascade Impactor (available from Anderson Sampler Inc., Atlanta, GA).

The aerosol vial to be tested is primed five 25 times. The valve and valve stem are then cleaned with methanol and dried with compressed air. The aerosol vial and a clean, dry actuator are coupled to the glass throat attached to the top of the impactor using an appropriate firing adaptor. The calibrated vacuum pump 30 (28.3 L/min) attached to the cascade impactor is turned on. A total of 20 sprays is delivered into the cascade impactor by repeatedly shaking the vial, seating it in the actuator and immediately delivering a single spray. The time between sprays is approximately 30 seconds. 35 The cascade impactor is disassembled and each component is rinsed separately with diluent (55 parts methanol mixed with 45 parts of 0.1 percent aqueous phosphoric acid, v/v). Each solution is analyzed for pirbuterol

WO 93/11747

PCT/US92/10587

- 26 -

acetate content using high performance liquid chromatography. The respirable fraction is calculated as follows:

$$5 \text{ % respirable} = \frac{\text{drug recovered from plates 3-7}}{\text{total drug}} \times 100$$
$$\text{total drug} = \text{drug recovered from}$$
$$\text{recovered actuator and valve}$$

Example 11

10 A 1.35 g portion of micronized pirbuterol acetate and 25 mL of glass beads were placed in a 120 mL (4 ounces) glass aerosol vial. The vial was sealed with a continuous valve, pressure filled with approximately 150 g of HFC 227 and then shaken for at least 10 minutes on an automatic shaker. The resulting formulation contained 0.9 percent by weight of pirbuterol acetate. The vial was then charged with 150 psi nitrogen to aid in product transfer to smaller vials. The formulation was transferred to 10 mL 15 aluminum aerosol vials sealed with continuous valves by using a valve to valve transfer button. The vials were then chilled in dry ice then the continuous valves were removed and the vials sealed with 25 μL metering valves. Using the method described above, the 20 respirable fraction was determined in duplicate for two separate vials. Values of 59.1 percent and 54.8 percent were obtained for vial 1. Values of 53.9 percent and 49.3 percent were obtained for vial 2.

25 Example 12

30 A 1.35 g portion of micronized pirbuterol acetate, 15.0 g of ethanol and 25 mL of glass beads were placed in a 120 mL (4 ounce) glass aerosol vial. The vial was sealed with a continuous valve, pressure 35 filled with approximately 134 g of HFC 227 and then shaken on an automatic shaker for at least 10 minutes. The resulting formulation contained 0.9 percent by weight of pirbuterol acetate and 10 percent by weight

WO 93/11747

PCT/US92/10587

- 27 -

of ethanol. Individual 10 mL aerosol vials were filled and sealed with 25 μ L metering valves using the method described in Example 11. Using the test method described above, the respirable fraction was determined 5 in duplicate for two separate vials. Values of 34.9 percent and 32.5 percent were obtained for vial 1. Values of 31.7 percent and 31.3 percent were obtained for vial 2.

In Examples 13-14 below respirable fraction 10 is determined using the test method described above but using a diluent of 45 parts by volume methanol and 55 parts by volume of 0.1 percent aqueous phosphoric acid.

Example 13

15 A 0.60 g portion of micronized albuterol sulfate and 25 mL of glass beads were placed in a 120 mL (4 ounce) glass aerosol vial. The vial was sealed with a continuous valve and then pressure filled with approximately 150 g of HFC 227. The vial was shaken to 20 disperse the albuterol sulfate. The resulting formulation contained 0.4 percent by weight of albuterol sulfate. The formulation was transferred to 10 mL aluminum aerosol vials sealed with continuous valves by using a valve to valve transfer button. The 25 vials were chilled in dry ice then the continuous valves were removed and the vials were sealed with 25 μ L metering valves. Using the method described above, the respirable fraction was determined in duplicate for two separate vials. Values of 69.3 percent and 60.6 30 percent were obtained for vial 1. Values of 64.0 percent and 63.0 percent were obtained for vial 2.

Example 14

35 A 0.60 g portion of micronized albuterol sulfate, 0.75 g of oleic acid, 22.5 g of ethanol and 25 mL of glass beads were placed in a 120 mL (4 ounce) glass aerosol vial. The vial was sealed with a continuous valve and then pressure filled with

WO 93/11747

PCT/US92/10587

- 28 -

approximately 126 g of HFC 227. The vial was shaken to disperse the albuterol sulfate. The resulting formulation contained 0.40 percent by weight of albuterol sulfate, 0.50 percent by weight of oleic acid and 15.0 percent by weight of ethanol. Individual aerosol vials were filled and fitted with 25 μ L metering valves using the method described in Example 13. Using the test method described above, the respirable fraction was determined in duplicate for two separate vials. Values of 28.0 percent and 22.0 percent were obtained for vial 1. Values of 27.1 percent and 28.8 percent were obtained for vial 2.

Example 15

A suspension aerosol formulation containing 0.37 percent by weight of albuterol sulfate, 0.10 percent by weight of sorbitan trioleate (commercially available under the trade designation Span 85), 9.95 percent by weight of ethanol and 89.58 percent by weight of HFC 227 was prepared. The formulation was deemed to be suitable for use in connection with a metered dose inhaler.

Example 16

A 4.5 g portion of ethanol was placed in a 125 mL (4 ounce) glass aerosol vial. The vial was sealed with a continuous valve then pressure filled with 147 g of HFC 227. Portions (approximately 225 mg) of micronized pirbuterol acetate were weighed into 30 separate 15 mL glass aerosol vials. A 5 mL portion of glass beads was added to each vial and the vials were sealed with continuous valves. Each vial was then pressure filled with approximately 19.8 g of the ethanol/HFC 227 solution. The resulting formulation contained 3 percent by weight of ethanol and 0.9 percent by weight of pirbuterol acetate. The vials were then shaken in a paint shaker for 15 minutes. The vials were cooled in dry ice, the continuous valves were

WO 93/11747

PCT/US92/10587

- 29 -

removed and the contents poured into separate 15 mL aluminum aerosol vials. The aluminum vials were sealed with 25 μ L valves equipped with diaphragms fabricated from C-Flex R-70-051 and tanks seals fabricated from DB218. Using the test method described above, the respirable fraction was determined for two separate vials. Values of 59.8% and 52.8% were obtained. Using the test method described above, the ability of the formulation to deliver a consistent dose throughout the "life" of the aerosol was determined. The results are shown in the table below. The values are the average for the indicated shots.

μ g Pirbuterol Acetate/shot			
	Shot #	Vial 1	Vial 2
15	1 & 2	279.4	304.6
	101 & 102	197.1	329.9

	301 & 302	295.8	294.1
20	401 & 402	269.6	350.3

Example 17

Using the general method of Example 16, 6 vials of a formulation containing 5 percent by weight of ethanol and 0.9 percent by weight of pirbuterol acetate were prepared. Using the method described above, the respirable fraction was determined for two separate vials. Values of 48.2% and 43.5% were obtained. Using the method described above, the ability of the formulation to deliver a consistent dose throughout the "life" of the aerosol was determined. The results are shown in the Table below.

31

WHAT IS CLAIMED IS:

1. A metered dose aerosol canister, equipped with a metering valve, containing a medicinal aerosol formulation suitable for inhalation comprising a therapeutically effective amount of a drug in suspension and a proellant selected from the group consisting of HFC 134a, HFC 227 and mixtures thereof, the formulation being further characterized in that it is free of surfactant,
10 includes 5 to 15 percent ethanol, and said drug is albuterol sulfate.
